ID ISC.LRM2000-A, ID ISC.LRM2000-B and ID ISC.LR2000-A

The ID ISC.LR2000 Long Range Reader and the ID ISC.LRM2000 Long Range Reader Unit are the top of the line Long Range Reader versions of the OBID i-scan HF product line.

The ID ISC.LR2000 and ID ISC.LRM2000 are the most powerful reader in the OBID i-scan HF product line. Both devices have identical RF performance. The ID ISC.LRM2000 differs from the ID ISC.LR2000 in terms of housing, interface options and functionality for the host connectivity of the device. **Features:** • Highly sensitivity receiver increased the tag detection range so that the most transponders can be read over the entire power up, field strength area • RF front end accommodates arbitrary cable lengths between the reader and the antenna without adversely affecting the read range of the antenna • RF front end has its own power control to protect the read range from external noise sources • The reader delivers a DC voltage on the antenna output to source DC powered devices connected to the antenna cable, such as the OBID i-scan Dynamic Antenna Tuning board (ID ISC.ANT.DAT-A) • RF source of the reader meets different national radio rules and can achieve the 60dbµA/m ETSI limits

The reader is able to directly control antenna multiplexing functions. The RF section of the reader is controlled by a dedicated DSP based, RF controller. A second microcontroller, the Application and Connectivity Controller (ACC), uses an ARM processor running a µcLinux operating system. The reader has four hardware interface ports: Ethernet, RS232, RS485, and a Compact Flash 2 compatible port to support a WLAN Card. All ports are under control of the ACC. In combination, the powerful and flexible RF transmitter and receiver and intelligent digital controller form the basis of an agile, multi protocol reader that can be updated as future protocols and features are created.

Tranceivers/Transmitters

Transceivers: The wireless control transceiver series is a family of low power consumption single chip FSK/ASK transceivers for half duplex low data rate communication. The IC offers a very high level of integration and needs only a few external components.

Features: • FSK and ASK modulation and demodulation • I^{2}C Controller interface • On-chip low pass channel select filter and data filter with tunable bandwidth • Onboard data filter • Data comparator • Data rate detection circuit

Transmitters: The Infineon wireless control transmitter series offers a high level of integration and needs only a few external components. The device contains a fully integrated PLL synthesizer and a high efficiency power amplifier to drive a loop antenna. A special circuit design and a unique power amplifier design are used to save current consumption and therefore to save battery life.

Features: • Temperature range -40°C ~ 125°C • FSK and ASK modulation

NEW! Retainer Contact for Board Shields

This retainer contact can be used for the one piece or frame-only two piece board shields. After the contact is soldered to the PCB, the board shield can slip between the contact points to retain the unit. This prevents soldering on the board shield itself.

Surface Mount Antennas

Dimensions in mm

MHW Series:
This antenna style provides a clever solution to the unique needs of difficult environments such as a vehicle. Designed to mount directly onto nonconductive interior surfaces such as wallboard, windows or a rear view mirror, these compact antennas are easily concealed, minimizing potential theft.

HDP Series:
A compact, center-fed antenna that achieves efficient operation at either or both of two frequency bands. Its durable, unobtrusive housing attaches permanently with integral adhesive to flat, nonconductive surfaces.

VDP Series:
Similar to the HDP Series but the cable enters from the bottom to facilitate vertical orientation. Also, this compact, center-fed antenna achieves efficient operation at any or all of three frequency bands. Attaches permanently with integral adhesive to flat nonconductive surfaces.

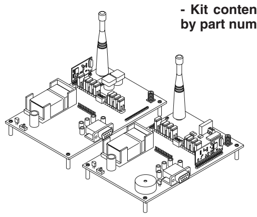
Evaluation Kits and Accessories

These kits provide the most complete opportunity to evaluate the Linx module series of your choice and then begin the integration of it into your own design.



HP Series Shown - Kit contents vary by part number

Basic Evaluation Kit:

This kit is a quick way to evaluate the field performance of Linx products. The kit does not allow for the level of testing and interface possible with Master Kits but provides a cost-effective starting point.

Master Evaluation/Development System Kit:

The kits not only allow evaluation of the module series you have chosen, but also speed the development of your own design via on-board prototyping area and breakout headers.

LC Series – Ultra-Compact Low-Cost RF TX Modules: Operating in the 260 ~ 470MHz band, these tiny RF modules provide a complete and cost-effective solution for the wireless transfer of serial control and command information over distances in excess of 300 ft.
• 2.7 ~ 5.2VDC range • 1.5mA average • +3dBm output • 5Kbps maximum data rate • Low harmonics

KH Series – Transmitter And Receiver Featuring Integrated Encoder/Decoders: This series combines the popular LC TX/RX with an integrated encoder/decoder pair. The encoder module accepts up to eight parallel inputs. This allows the direct connection of switches or a microcontroller.

KH2 Series – This series is ideally suited for applications such as remote control/command and keyless entry. It combines a high-performance RF receiver with an on-board decoder. When paired with a matching KH Series transmitter/encoder module, OEM transmitter, or LC or LR Series transmitter and Holtek HT640 encoder combination, a highly reliable wireless link is formed, capable of transferring the status of 8 parallel inputs for distances of up to 3,000 ft. Ten tri-state address lines provide 59,049 (3^{10}) different addresses.

RM Series – Provides a complete TX/RX solution in a compact SIP style module. This series utilizes an advanced SAW based design and FM/FSK modulation and operates in the 260 ~ 470MHz band.
Rx: • 4.0 ~ 9.0VDC range • 14mA average • -103 Typical sensitivity

HP3 Series – High-Performance, Low-Cost, RF TX/RX Modules: These modules are designed for the popular 902 ~ 928MHz band. The modules offer 8 or 256 selectable channels and are capable of transmitting analog and digital information for distances of up to 1000 feet. Available in SIP or SMT package.
Tx: • 8 parallel selectable channels on PO series and 8 parallel 120 serial on PS series • Synthesized architecture • 2.7 ~ 3VDC supply range • Low power (15mA average current): • 0dbm output power • 100Hz ~ 25kHz analog bandwidth • CTS
Rx: • 8 parallel selectable channels on PO series and 8 parallel 120 serial on PS series • Synthesized architecture • 2.7 ~ 18VDC supply range • Low power (18mA average current; 50µA powerdown) • 50Kbps maximum data rate • 50Hz ~ 25kHz analog bandwidth • RSSI output • Powerdown control

BBA Series – Broadband RF Amplifiers: These amplifiers are well suited to a wide range of amplification and buffering applications including extending the range of Linx's own RF modules (when legally appropriate). The hybrid amps are pre-matched to 50Ω and require no external RF components.
BBA-322: • High gain model • 10MHz ~ 3GHz broadband operation • +20dB small signal gain at 900MHz • Up to +10 (10mW) Linear output power • 3.8dB noise figure • Operates from a single supply
BBA-519: • High output model • 10MHz ~ 4GHz broadband operation • +18dB Small Signal gain at 900MHz • Up to +17 (50mW) Linear output power • 4.8dB noise figure

ES Series – Housed in a tiny SMD package, this series utilizes an advanced FM/FSK-based synthesized architecture to provide superior performance and noise immunity when compared to AM/OOK solutions. An outstanding 56Kbps maximum data rate and wide-range analog capability make the ES Series equally at home with digital data or analog sources such as audio. A host of useful features including RSSI, PDN, audio reference, LVL ADJ, low-voltage detect and a microprocessor clock source are provided. Operates at 916.48MHz which in North America allows an unlimited variety of applications including data and audio links. Audio 20Hz ~ 28kHz, very low current for long life in battery applications.
Tx: • Supply voltage: 2.1V ~ 4V • Current: 6.5 ~ 7.5mA • 0dbm output power • Sleep: 90µA

Micro-Module Bluetooth®

A highly integrated Bluetooth 1.2 compliant solution. The integrated baseband controller and 2.4GHz radio combine to form a complete, small form-factor (6.1mm x 9.1mm x 1.2mm) Bluetooth node. The baseband controller has a standard Host Controller Interface (HCI). The firmware supplied in the on-chip ROM supports a complete Bluetooth Link Manager and HCI with communication through a UART or USB interface. This firmware features point-to-point and point-to-multipoint link management, supporting data rates up to 723kbps. The radio has a heterodyne receiver architecture with a low intermediate frequency (IF), which enables the IF filters to be integrated on-chip. The transmitter uses direct IQ-modulation with Gaussian-filtered bit-stream data, a voltage controlled oscillator (VCO) buffer and a power amplifier.

LMX5453 Bluetooth 2.0 compliant solution **Features:** • eSCO • eSCO over USB HCI transport

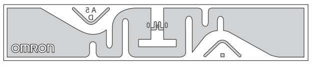
RFID Product

RFID Inlays and Labels for V750 Series

RFID Inlay



In contrast to bar codes, RFID (Radio Frequency Identification) uses radio waves to send information such as a unique ID of a product to an antenna, which is then read by the reader. This ID or programmed information is displayed on a host, such as your computer. With RFID you can find all of your goods more effectively without having to see them directly or unpacking boxes/pallets. Furthermore, multiple ID tags/Inlays can be read while being moved in a warehouse or plant.

Receiver and Transmitter Modules

Radios Inc. provides receiver and transmitter modules based on the Micrel RF line of products for applications like keyless entry, remote access, periodic data transfer, and many more. The relay modules provide a decoder along with the receiver IC, allowing for control of powered systems remotely. The handheld transmitters provide a 2-button interface for remote communication with the desired receiver with the appropriate decoder. The HHDS-ML development systems provide an evaluation environment for range, firmware, and electrical testing. The DS-ML development systems include a breadboarding area and higher functionality testing of the devices. The HHDS-ML and DS-ML allow for development with any of the pinned receiver/transmitter modules, which are purchased separately.

Bluetooth® Modules and Accessories

Roving Networks provides solutions for virtually any Bluetooth application. Utilizing CSR's BlueCore line of Bluetooth ICs, they provide modules with a small size, low power and high performance. The modules are compliant with 1.1/1.2/2.0 Bluetooth devices, allowing for ease of use. The SuperModules (RN-24x) provide a simple ASCII interface, with no need to develop a host Bluetooth stack. The adaptors provide rapid replacement of serial cables and an auto-connect feature, removing the need to Bluetooth network setup. The data acquisition module provides a low power sensor monitor/control module, with a simple interface and command structure. WiFly modules allow simple integration of 802.11 b/g in a very low power module, providing excellent battery life.

RFID Evaluation Kit

The DEMOKITCRX14 tools are designed to demonstrate the STMicroelectronics short range product range that includes the SR176, SRIX512 and SRIX4K products. The SR176 / SRIX512 / SRIX4K is contactless memory, powered by a transmitted carrier radio wave at 13.56MHz. It contains a 176-bit (SR176), 512-bit (SRIX512) or 4096-bit (SRIX4K) EEPROM, with memory mapping organized as blocks of 16 or 32 bits. It conforms to the ISO 14443-B recommendation for the transfer of power and signals via radio transmission. The DEMOKITCRX14 reader circuitry amplitude modulates (10% modulation) the data on the carrier using amplitude shift keying (ASK). The SR176 / SRIX512 / SRIX4K replies by load modulating the data on the carrier using the BPSK (Bit Phase Shift Keying) coding using the 847kHz sub-carrier. The data transfer rate in each direction is 106 Kbit/second. The purpose of the DEMOKITCRX14 program is to give an example of how the interfacing can be achieved. It does not allow the user to evaluate all of the different ISO 14443 modes. The DEMOKITCRX14 gives access to the full memory mapping. It is possible to read and write into the selected SR176 / SRIX512 / SRIX4K. This release of demonstration software, differentiated for each SR176 / SRIX512 / SRIX4K, allows all of the product features to be exercised.

Kit Includes:

• One CD-ROM • One CRX14 board with I^{2}C connector • One USB Transceiver with USB cable • Some SR176 and SRIX4K Samples • Documentation

CR14 and CRX14 Coupler Chips

RoHS COMPLIANT

The CR14 and CR14X series are contactless couplers that are compliant with the short range ISO14443 type-B standard. They are controlled using the two wire I^{2}C bus. They generate a 13.56MHz signal on an external antenna. Transmitted data is modulated using Amplitude Shift Keying (ASK). Received data is demodulated from the PICC (Proximity Integrated Coupling Card) load variation signal, induced on the antenna, using Bit Phase Shift Keying (BPSK) of a 847kHz sub-carrier. The Transmitted ASK wave is 10% modulated. The data transfer rate between the CR14/CRX14 and PICC is 106Kbit/second in both transmission and reception modes.

Bluetooth® Modules

GS-BT2416xx is the series of Bluetooth core embedded modules intended for audio Hi-Fi and Industrial applications based on the STLC2416 baseband controller with 4Mbit flash and the STLC2150 radio transceiver. The series supports protocol layers up to HCI and it represents a cost effective packaged solution for customers in need of a simple wireless link. The Bluetooth approach is facilitated by the Serial Port Profile (SPP) firmware embedded in GS-BT2416CX.AT1. This ready-to-go solution is simply managed by AT commands. The modules are also available in Class 1 and Class 2 for either long range or low power. Bluetooth v1.2 compliant. **Features:** • Class 1 (long) and Class 2 ranges • Bluetooth v1.2 compliant • Embedded SPP profile for cable replacement • AT commands set • HCI interface over UART and USB • Single 3.3V voltage supply with embedded voltage regulator

SPBT2532C2.AT is a surface-mount PCB module that provides fully embedded, ready-to-use Bluetooth wireless technology. It is designed for maximum performance in a minimal space and includes four general purpose and four A/D IO lines, several serial interface options, and up to 2 Mbps data throughout. The re-programmable Flash memory contains embedded firmware for serial cable replacement using the Bluetooth SPP profile.

This user manual describes the **STEVAL-SPBT2ATV1** demonstration board for the Bluetooth class 2 SPBT2532C2.AT module. The board includes the module under evaluation, an RF antenna, and a USB connector. The USB connector is used to connect the board with a PC, to access the Bluetooth module and to supply the board. The STEVAL-SPBT2ATV1 is a board with downloaded FW which enables the user to create a Bluetooth link with simple AT commands. It is an easy solution to test and operate with the SPBT2532C2.AT module. **Features:** • Bluetooth V2.1 board • USB connection • SMD antenna on board

RF Transceivers/Transmitters

CC1110 and CC2510 Mini Development Kits: These System-on-Chip (SoC) devices are designed for low power wireless applications. CC1110 operates in the sub-1GHz unlicensed ISM bands while the CC2510 operates in the 2.GHz unlicensed ISM bands. Both combine the excellent performance of the state-of-the-art CC1101 and CC2500 RF transceivers respectively with an industry-standard enhanced 8051 MCU, up to 32kB of in-system programmable flash memory and up to 4kB of RAM, and many other powerful features. **Kits Include:** • Two SmartRF CC1110 or SmartRF CC2510 target boards • One CC Debugger including the necessary cables and connector converters • Four AAA batteries • CD with Evaluation version of the IAR EW8051 • Documentation

CC1111EMK868-915 Kit: This evaluation module/USB dongle is designed to help the user to achieve objectives as quickly as possible. A CC1110DK is needed to program the CC1111 USB dongle (the CC1110DK must be ordered separately). The CC1111 868 and 915MHz USB dongle can be used to test the communications without having to connect the CC1101/CC1150/CC1110 development kit to the PC. **Kit Includes:** • One CC1111 USB dongle with chip antenna for 868 and 915MHz operation

CC2420EMK Kit: CC2420 is a true single chip 2.4GHz 802.15.4 compliant RF transceiver designed for low-power and low-voltage wireless applications. The CC2420EMK evaluation kit in combination with a CC2420 development kit makes it easy for the user to evaluate the RF performance of the CC2420. **Kit Includes:** • Two CC2420 evaluation modules and two antennas. The CC2420EM are add-on daughter boards that require a CC2420DK or CC2420DBK development kit for evaluation and development.

CC2430DK Kit: The SmartRF®04DK development kit includes a number of functions and applications that allows quick testing of the RF interface and peripherals of the chip. Right out of the box, the kit can be used for range testing using the SmartRF®04DK products. The radio can be easily configured to measure sensitivity, output power and other RF parameters. **Kit Includes:** • Two SmartRF®04EB • Two CC2430EM evaluation modules • Two 2.4GHz antennas • Two USB cables • One 10-wire flat cable for using SmartRF®04EB as emulator for external target systems • Quick start guide • IAR EW8051 C-compiler with C-SPY debugger (30+30 days evaluation license)

CC2500EMK Kit: These evaluation modules in combination with a motherboard from a CC2500 development kit are designed to help the user to achieve objectives as quickly as possible. Right out of the box the user can do range testing (PER testing) and transfer data from one PC to another using the SmartRF®04DK. **Kit Includes:** • Two CC2500EM evaluation modules • Two antennas

CC2533 Kit: The CC2533 is an optimized System-on-Chip (SOC) solution for IEEE 802.15.4 based remote-control systems. It enables single-chip remote controls to be built with low bill-of-material cost when used as a flexible SoC. It also provides a simple path to adding RF4CE capability to a device or target when used in the wireless network processor configuration of the RemoTI RF4CE stack. Robust network nodes can be built with very low total bill-of-material costs.

CC2591EMK Kit: The CC2591EM can be used as an add-on to your existing 2.4GHz system to increase output power to +20dBm and improve receiver sensitivity up to 6 dB. The kit requires that you already have another complete 2.4GHz development kit or RF board. **Kit Includes:** • Two CC2591EM Evaluation Modules with the CC2591 and required external components • Two 2.4GHz antennas

eZ430-RF2480 Demo Kit: A complete USB-based MSP430 wireless demonstration tool providing all the hardware and software to evaluate the CC2480 2.4GHz ZigBee network processor and the MSP430F2274 microcontroller. **Kit Includes:** • Three CC2480 Target Boards • One eZ430 USB Emulator Board • Two AAA eZ430 Battery Boards (batteries included) • ZASA installer with Project files and Quick Start Guide • eZ430-RF2480 Sensor Monitor Installer • ZigBee Documentation

eZ430-RF2500T Target Board: An out-of-the-box wireless system that may be used with the USB debugging interface, as a stand-alone system with or without external sensors, or may be incorporated into an existing design.

PAN1315 Module Kit: The PAN1315 Evaluation Module Kit (EMK) is a highly versatile, advanced TI Bluetooth® development tool. The kit, when coupled with the MSP430F5438 Experimenter Board, enables customer's early software and hardware prototyping capabilities for wireless embedded applications. The tool includes 2 PAN1315ETU's (Easy to Use) boards each containing a Panasonic PAN1315 Bluetooth 2.1+EDR HCI Module, on board antenna and RF thru-line connector.

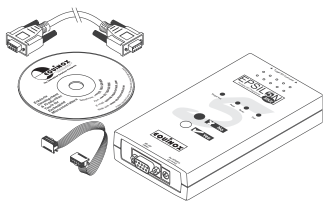
EPSILON5 — Portable ISP Programmer

The EPSILON5 Portable USB ISP Programmer is a high-speed development/field/production programmer supporting most In-System Programmable (ISP) Microcontrollers from Atmel, Philips and Zensys.

The programmer can be operated under PC control during development and for project configuration/uploading using the EQTools Toolsuite. The EPSILON5(AVR-JTAG) supports high-speed In-System Programming (ISP) of Atmel AVR Microcontrollers via the JTAG interface.

EPSILON5 — Portable ISP Programmer



EPSILON5 — Portable ISP Programmer:

Features: • Supports PC Controlled and Standalone Programming • Development Mode - Using Equinox Development Suite (EDS) under PC control • Standalone Mode - Ideal for field or small-scale production use (no PC required) • Fastest programming times possible due to on-board data, high-speed SPI and JTAG port • Supports programming of FLASH, EEPROM, FUSE bits, Security bits and RC Oscillator Calibration bytes • 2Mbits of on-board non-volatile FLASH memory for user project storage (Standalone Mode) • JTAG Port - FAST ISP using JTAG algorithm • Equinox Development Suite (EDS) • Project Builder - To create/edit Programming Projects • Project Manager - To create and maintain Project Collections • Project Upload/Download Utility - To upload projects to the programmer for use in Standalone Mode

ATmega AVR JTAG Upgrade Bundle:

The “ATmega AVR JTAG” License Upgrade for Equinox ISP Programmers supports high-speed In-System Programming (ISP) of Atmel ATmega AVR Microcontrollers via their on-chip JTAG port. The JTAG algorithm yields much faster programming times (3-4 times faster) than the traditional SPI algorithm due to an enhanced protocol and higher bus speed. It is also possible to program multiple AVR Microcontrollers which are part of a JTAG Chain on the same Target System using JTAG algorithm.

Note: For more information, please see Digi-Key web site.

In-System Programmable CPLDs (Complex Programmable Logic Devices)

The **XC9500 CPLD** family provides advanced in-system programming and test capabilities. All devices have a minimum of 10,000 program/erase cycles. Extensive IEEE 1149.1 (JTAG) boundary-scan support is also included on all family members. The XC9500 family is fully pin-compatible allowing easy design migration. Advanced system features include output slew rate control and user programmable ground pins to help reduce system noise. I/Os may be configured for 3.3V or 5V operation. All outputs provide 24mA drive.

The **FastFLASH XC9500XL** family is a 3.3V CPLD family targeted for high-performance, low-voltage applications. The XC9500XL architectural features address the requirements of in-system programmability. Each user pin is compatible with 5V, 3.3V, and 2.5V inputs, and the outputs may be configured for 3.3V or 2.5V operation. The XC9500XL device exhibits symmetric full 3.3V output voltage swing.

The **CoolRunner™-II** device is a 3.3V CPLD targeted at power sensitive designs that require leading edge programmable logic solutions. CoolRunner CPLDs offer a TotalCMOS™ solution, both in process technology and design technique. Xilinx employs a cascade of CMOS gates to implement its sum of products instead of the traditional sense amp approach.

Programmable Gate Arrays

FPGA (Field Programmable Gate Arrays)

A Technical Overview: Every Xilinx FPGA performs the function of a custom LSI circuit, like a gate array, but the Xilinx device is user-programmable and even reprogrammable in the system. Xilinx sells standard off-the-shelf devices in many different sizes, speeds, operating temperature ranges and packages. The user selects the appropriate Xilinx device and then converts the design idea or schematic into a configuration data file, using the Xilinx development system software, and loads this file into the Xilinx FPGA. **XC3000A** • Five device types (1300 ~ 7500 gates) • 4-input look-up tables • Flip-flop toggle rate over 110MHz • No on-chip RAM, data storage limited to flip-flops • Use for medium speed, medium complexity applications **XC3100A** • Functionally and bitstream identical with XC3000A series • Five device types (1300 ~ 7500 gates) • 4-input look-up tables • No on-chip RAM, data storage limited to flip-flops • Use for high performance design, system clock up to 100MHz **XC4000** • Benefits of custom CMOS VLSI • Gate ranges from 2,000 ~ 20,000 • Unlimited reprogrammability **XC4000E** • Ten device types (2,000 ~ 25,000 gates) • Dedicated carry network • Function generator can be used as RAM • Use for general purpose logic and data-path logic **XC4000L** • Low voltage version of XC4000E devices (3.0 ~ 3.6V) **XC4000XL** • Low voltage version of the XC4000EX devices (3.0 ~ 3.6V)

ALTERA® FPGAs

ARRIA®: Combines protocol-optimized serial transceivers with reliable packaging technology and a proven logic array. These devices include 4 ~ 12 high-speed transceiver channels, each incorporating clock/data recovery (CDR) technology and embedded SERDES circuitry optimally designed to support PCI-Express, Gigabit Ethernet, and Serial RapidIO protocols. The transceivers have been optimized to simply and efficiently implement bridging and endpoint applications.
ARRIA II: GX FPGA family offers a range of devices from 17K ~ 260K logic elements, provides up to 11.8Mb of memory, and supports up to 16 transceivers. Arria II GX FPGAs support vertical migration, which allows the flexibility of starting designs today with one device and, if desired, moving to a different density device later.
ACEX®: High-performance embedded RAM blocks that can implement dual-port RAM, ROM, FIFO or logic • 64-bit, 66MHz PCI support • PLLs for clock management • ClockBoost® feature to multiply the system clock inside the ACEX 1K device • MultiVolt™ I/O operation
APEX™: With devices ranging from 30,000 ~ 1.5 million system gates and clock rates up to 840MHz, Altera's APEX 20K FPGA family offers complete system-level integration on a single device, leading to extensive cost and performance advantages.
CYCLONE®/CYCLONE II: A low-cost alternative to ASICs. Cyclone provides a flexible, risk-free option without up-front non-recurring engineering charges. A low-cost solution unmatched by any other FPGA Cyclone II devices offer advanced features such as embedded 18 x 18 multipliers for high-performance (DSP) applications and support for memory interfaces such as DDR2 (up to 334 Mbps) and QDRII (up to 668 Mbps).
CYCLONE III: Delivers an unprecedented combination of low power, high functionality, and low cost. Cyclone III FBGAs also include a number of features and enhancements, intellectual property support, and other design resources to optimize them for use in specific application areas.
CYCLONE IV: device family extends the Cyclone FPGA series leadership in providing the market's lowest cost, lowest power FPGA's now with a transceiver variant. Cyclone IV devices are targeted to high-volume, cost-sensitive applications, enabling system designers to meet increasing bandwidth requirements while lowering costs. Built on an optimized low-power process, the Cyclone IV device family offers two variants: • **Cyclone IV E:** lowest power, high functionality with the lowest cost • **Cyclone IV GX:** lowest power and lowest cost FPGA's with 3.125 Gbps transceivers
STRATIX®: This device family is based on a 1.5V, 0.13µm, all-layer-copper process • Up to 79,040 logic elements • 7Mbits of embedded memory, optimized (DSP) blocks, and high-performance I/O capabilities.
STRATIX II: Based on a 1.2V, 90nm, SRAM process, with densities from 15,600 ~ 179,400 logic elements. Up to 9Mbits of on-chip RAM. Up to 12 PLLs and 16 global clock networks. Up to 384 embedded multipliers in DSP blocks, source-synchronous differential signaling with dedicated (DPA) circuitry operating at up to 1.040 Gbps. • Dedicated serializer/deserializer (SERDES) circuitry to support the LVDS and HyperTransport™ differential I/O electrical standards, supports 10 Gigabit Ethernet XSBI, SFI-4, SPI-4.2, HyperTransport, RadioIO™ and UTOPIA IV standards.
STRATIX II GX: This device family is Altera's third generation of FPGAs to combine high-speed serial transceivers with a scalable, high-performance logic array. Stratix II GX devices include 4 ~ 20 high-speed transceiver channels, each incorporating clock/data recovery (CRU) technology and embedded SERDES capability at data rates of up to 6.375Gbps. The transceivers are grouped into four-channel transceiver blocks, and are designed for low power consumption and small die size. The Stratix II GX FPGA technology is built upon the Stratix II architecture, and offers a 1.2V logic array. This makes Stratix II GX devices ideal for high-speed backplane interface, chip-to-chip, and communications protocol-bridging applications.
STRATIX III: This family includes the following two device variants: • Stratix III L devices focus on logic-rich applications • Stratix III E devices focus on digital signal processing (DSP)-rich and memory-rich applications. • The Stratix III offers vertical migrations, not only within, but across the L and E variants to offer the most flexibility in device selection. Altera has taken the industry leading architecture of the Stratix device series and refined it even further for a 65-nm process node. As a result, Stratix FPGAs are the ideal solution for your next generation high-end designs.
STRATIX IV: A breakthrough level of system bandwidth and power efficiency for high-end applications, allowing you to innovate without compromise. Based on the Taiwan Semiconductor Manufacturing Company (TSMC) 40-nm process technology and surpass all other high-end FPGAs, with the highest logic density, most transceivers, and lowest power requirements.
STRATIX IV GX: These transceivers are based on 40nm technology and include a number of features that ensure excellent jitter performance combined with superior signal integrity for both backplane and chip-to-chip applications.
FLEX® 6000: Programmable logic device family delivers the flexibility and time-to-market of programmable logic at prices that are competitive with gate arrays. CPLDs

Altera's Max families include the cost-optimized MAX 3000 and the high-performance MAX 7000 CPLD's, each of which offers densities, packages and speed grades to meet a variety of design needs. Altera's MAX CPLD's are non-volatile, single-chip solutions that do not require additional configuration devices. This means that they can be pre-programmed and reprogrammed using in-system programmability (ISP) and will retain the programming algorithm securely, even when the device is powered off.

Configuration Devices

During device operation, Altera® FPGA's store configuration data in SRAM cells. Because SRAM memory is volatile, the SRAM cells must be loaded with configuration data each time the device powers up. You can configure the devices using data stored in an Altera configuration device. Altera configuration devices are offered in different densities and provide a variety of features.

CPLDs (Complex Programmable Logic Devices)

Atmel offers a broad range of high-density, low-power, and cost-effective solutions enabling designers to create products that are "just what the market ordered." Based on a standard architecture, which uses industry standard development tools, Atmel's CPLDs offer the unique low-power or "L" feature while providing 100% connectivity. These devices are processed with Atmel's proprietary 0.65-micron processes and have a EEPROM memory.

The ATF750/C CPLDs are based on a 22V10-type architecture and provide market-leading capacity and flexibility in a 22V10 footprint with twice the registers and additional features for better logic utilization.

The ATF1500 Series is targeted at wider logic density, with higher number of I/O's. This family has devices from 44 ~ 160 pins, and 32 ~ 96 I/O's. High connectivity, and flexible architecture make these parts highly suitable for system design. In system programmability in the larger devices allow for reconfiguration even after the device is in the system.

Standard Development Tools:
Atmel's philosophy is that designers should be able to use known development tools. Third-party design tools such as Synario™, ABEL™, CUPL™, PPLDesigner-XL™, LOG/iC™, and PLDSyn™ support Atmel's EPLDs. Also Atmel-specific versions of the popular Synario, ABEL, and CUPL design tools are offered. In addition, workstation support is available on popular platforms with Viewlogic, MINC, Cadence, Mentor, and Synopsys.

FPGA's (Field Programmable Gate Arrays)

AT40K Series FPGAs

Atmel's AT40K Series coprocessor FPGAs range from 5K to 50K usable gates, and are designed for high density, compute-intensive DSP and other fast logic designs. The AT40K family solves the Logic vs. SRAM trade-off problem by providing fast, flexible, distributed 10ns FreeRAM™ without using valuable logic resources. Structured logic functions, including variable array multipliers can be implemented directly in core cells without using any bussing resources - providing dramatic improvements in speed, utilization, power and system cost. The AT40K family has the ability to implement Cache Logic design, where part of the FPGA can be reprogrammed without loss of register data, while the remainder of the FPGA continues to operate without disruption. This is ideal for building adaptive filters, variable coefficient multipliers and other designs where the datapath can change to increase system performance. All Atmel FPGAs can be designed using industry standard CAE tools for schematics, VHDL and Verilog on a PC, Sun, or HP workstation.

Features:

• Distributed, single/dual port 10ns SRAM, independent of logic cells • Up to 384 PCI compliant I/Os • Mixed 3V/5V capability • Architecture optimized for efficient, ultrafast array multipliers • Cache Logic® dynamic full/partial reconfigurability in-system • Eight global clocks • Efficient, industry-standard design tools, optimized for synthesis • QuickChange™ tools for adaptive hardware designs • Variety of surface mount packages • All devices in family are pin-compatible

AC Current Sensors

The Si85xx products are unidirectional AC current sensors available in full-scale ranges of 5,10 and 20A. Si85xx products are ideal upgrades for older current-sensing technologies offering size, performance and cost advantages over current transformers, Hall effect devices, DCR circuits and other approaches. The Si85xx products are extremely low loss, adding less than 1.3mΩ of series resistance and less than 2nH series inductance in the sensing path at 25°C. Current-sensing terminals are isolated from the other package pins, providing up to 5kV$_{RMS}$ isolation level per safety approval ratings.

Features: Single-chip AC current sensor • Leading-edge noise suppression eliminates need for leading-edge blanking • "Ping-Pong" output version allows one Si85xx to replace two low current transformers in full-bridge designs • FAULT output helps safeguard operation • ±5% initial accuracy • Large 2 Vpp minimum output at full scale • High-side or low-side current sensing • -40°C ~ 125°C operating range • 12-QFN and 20-SOIC packages
Applications: Power supplies • Motor controls • Lighting equipment • Industrial equipment

NEW! LCD Controllers

The CP240x extremely low power LCD controller devices can drive up to 128 LCD segments. These devices are easily interfaced with any microcontroller using SPI or I^{2}C interfaces. A benefit to this approach is designers can select the best-fit MCU for the system and then add the CP240x to handle LCD requirements efficiently with respect to system size and power consumption.

Ethernet Controllers

The CP220x is a single-chip Ethernet controller containing an integrated IEEE 802.3-compliant Media Access Controller (MAC), a 10 Base-T Physical Layer (PHY), and 8kB of non-volatile Flash memory available in either a 28-pin QFN (5mm x 5mm), or 48-pin TQFP (9mm x 9mm) package. The on-chip Flash memory may be used to store user constants, web server content, or can be used as general purpose nonvolatile memory. The Flash is factory pre-programmed with a unique 48-bit MAC address stored in the last six memory locations. Having the unique MAC address stored in the CP220x often removes the necessary serialization step from the product manufacturing process of most embedded systems.

Power over Ethernet

The Si3400 integrates an IEEE 802.3af compliant interface and complete power management solution for a Power over Ethernet (PoE) powered device (PD) application. The Si3400 converts the high voltage supplied over a 10/100/1000BASE-T Ethernet cable into a regulated low voltage output supply. For applications that require more power than the 11W (max) capability of the Si3400, the Si3401 provides the same feature set as the Si3400 but adds an increased hot swap switch current limit of 470mA (min.), versus the Si3400's 350mA (min.). The Si3401's higher current limit enables it to support applications in the range of 14 ~ 16W.

Single-Chip Voice Record/Playback Devices

General Description:
Nuvoton's patented ChipCorder® technology is a revolutionary multilevel technique to record and play back sound on a single-chip. The advanced technology provides natural sound reproduction, in a cost-effective device that retains stored messages in the event of power loss or battery replacement. The technology, based on a unique multilevel storage approach, stores multiple voltage levels into previously binary, two level EEPROM memory cells. Unlike traditional voice solutions whereby voice is digitized, the Nuvoton approach stores analog signals directly into single cells as one of over 250 levels. All ChipCorder products integrate the oscillator, microphone pre-amplifier, automatic gain control, anti-aliasing filter, smoothing filter, and speaker amplifier on-chip to achieve a complete "system on a chip." Only a microphone, speaker, power source, and a few passive components are needed to implement a complete record/playback function.

ISD15100 Series: Description: The ISD15100 Series is a multi-message ChipCorder featuring digital compression, comprehensive memory management, flash storage, and integrated analog/digital audio signal paths. The message management feature is designed to make message recording simple and address-free as well as make code development easier for playback only applications. This family utilizes flash memory to provide non-volatile audio record/playback for a single-chip solution. Unlike other ChipCorder series, the ISD15100 series provides digital audio interface, faster digital recording, higher sampling frequency, and a signal path with SNR equivalent to 12bit resolution. The ISD15100 series can take digital audio data via I2S or SPI interface. When I2S input is selected, it will replace the analog audio inputs and will support sample rates of 32, 44.1 or 48 KHz depending upon clock configuration.

ISD1600B Series: Description: The ISD1600B Series ChipCorder is a single-message, single-chip, record/playback solution with selectable durations from 6.6 to 40 seconds. With the ISD1600B device a minimum record/playback subsystem can be configured with a microphone, a speaker or buzzer, several passive components, two push buttons, and a power source. **Features:** 2.4 ~ 5.5 operating voltage. Sample frequency 4KHz ~ 12KHz controlled by external resistor.

ISD1700 Series: Description: The ISD1700 series allows durations of up to 480 seconds (dependant on sample rate). Because of an integrated trigger and SPI interfaces this series can operate in stand-alone or embedded mode. **Features:** 2.4 ~ 5.5 operating voltage. Sample frequency 4KHz ~ 12KHz controlled by external resistor

ISD1900 Series: Description: The ISD1900 ChipCorder is the newest single-chip multiple-message record/playback series with dual operating modes (address trigger and direct trigger) and wider operating voltage ranging from 2.4V ~ 5.5V. The sampling frequency can be selected from 4 ~ 12KHz via an external resistor, which also determines the duration from 10.6 ~ 32 seconds. These ICs are designed mostly for standalone applications, and of course, it can be used in conjunction with a microcontroller, if necessary. The two operating modes are address trigger and direct trigger.

ISD400X Series: Description: The ISD4000 series provides high-quality, 3 volt, single-chip record/playback solutions for 2 to 4 minutes (ISD4002), 4 to 8 minutes (ISD4003), and 8 to 16 minutes (ISD4004) messaging applications. These CMOS-based devices include an on-chip oscillator, anti-aliasing filter, smoothing filter, AutoMute™ feature, audio amplifier, and high density, multilevel Flash storage array. **Features:** • Single +3 volt supply • Low-power consumption • AutoMute feature to provide background noise attenuation • Fully addressable to handle multiple messages • On-chip clock source • Microcontroller SPI or Microwire™ Serial Interface

ISD5008 Series: Description: The ISD5008 device is designed for use in a microprocessor- or microcontroller-based system. Address, control, and duration selection are accomplished through a Serial Peripheral Interface (SPI) or Microwire Serial Interface to minimize pin count. Recordings are stored in on-chip nonvolatile memory cells, providing zero-power message storage. Voice and audio signals are stored directly into solid-state memory in their natural, uncompressed form, providing superior quality voice and music reproduction. **Features:** • Fully-integrated solution • Low-power consumption • Single +3 volt supply • Enhanced voice features • Easy-to-use and control • High quality solution

ISD5116 Series: Description: The ISD5116 ChipCorder Product provides high quality, fully integrated, single-chip Record/Playback solutions for 8-16 minute messaging applications that are ideal for use in cellular phones, automotive communications, GPS/navigation systems and other portable products. **Features: Fully-integrated solution:** • Single-chip voice record/playback solution • Low-power consumption supports 2.0V and 3.0V interface logic • Enhanced voice features • Digital memory features up to 4 MB • Easy-to-use and control • High quality voice and music reproduction

BASIC Stamp® Microcontrollers

Features:
A BASIC Stamp is a single-board computer that runs the Parallax PBASIC language interpreter in its microcontroller. The developer's code is stored in an EEPROM, which can also be used for data storage.
The PBASIC language has easy-to-use commands for basic I/O, like turning devices on or off, interfacing with sensors, etc. More advanced commands let the BASIC Stamp module interface with other integrated circuits, communicate with each other, and operate in networks.
The BASIC Stamp microcontroller has prospered in hobby, lower-volume engineering projects and education due to ease of use and a wide support base of free application resources.

PARALLAX Propeller™ and SX Chips

Propeller Chip: The Propeller Chip makes it easy to rapidly develop embedded applications. Its eight processors (cogs) can operate simultaneously, either independently or cooperatively, sharing common resources through a central hub. The developer has full control over how and when each cog is employed; there is no compiler-driven or operating system-driven splitting of tasks among multiple cogs. A shared system clock keeps each cog on the same time reference, allowing for true deterministic timing and synchronization. Two programming languages are available: the easy-to-learn high-level Spin, and Propeller Assembly which can execute at up to 160 MIPS (20 MIPS per cog).

SX Chip: The Parallax SX Chip is a RISC architecture, high-speed microcontroller with expanded flash program memory, in-system programming and debugging capability.

Operating at frequencies up to 75 MHz with an optimized single-cycle instruction set, developers can implement real-time functions as software modules.

Common examples include communication interfaces (I2C, SPI, UARTs), frequency generation and measurement, PWM, and sigma-delta A/D.

In addition, asynchronous and synchronous Bit-Bang interface modes are available. USB to parallel designs using the FT245R have been further simplified by fully integrating the external EEPROM, clock circuit and USB termination resistors onto the device. The FT245R adds a new function compared with its predecessors, effectively making it a "2-in-1" chip for some application areas.

Hi-Speed Multichannel USB to UART/FIFO IC Devices (FT2232H/FT4232H): The FT2232H (dual-channel) and the FT4232H (quad-channel) are USB 2.0 Hi-Speed (480Mb/s) to UART/FIFO ICs capable of being configured in a variety of industry standard serial or parallel interfaces by utilizing the Multi-Protocol Serial Synchronous Engines (MPSEE) which allow for communication using JTAG, I2C and SPI.

ER3 EconoROM III Economical EPROM Emulator

EconoROM III is designed for quick, in-circuit firmware test cycles. Eliminate the "burn/insert/test/remove/erase" cycle. The ER3 will speed up your firmware development by eliminating the need to remove-erase-program and re-install EPROMs each time you test a code change. These devices plug into the EPROM socket on your target board and emulate the EPROM throughout the development process.

Features:

• Integrated Low-Voltage Support • Target Voltage Sense and Measurement • External Power Option • Jumper-less Address Configuration • Up to 8Mbit Emulation in a single unit • Fast Downloads (up to 2.5 Mbit per second) • Replaces standard EPROM device during development • Connects to any Parallel Port • Auto/Manual Target Reset on download • Read-back, Verify and Self-test functions • Daisy-chain cable included • LPT cable (8 wire Modular Cable and DB25 adapter) included • Target cables (standard IDC to DIP Ribbon Cable) included • Includes 2 versions of software: 16 bit DOS version and 32 bit Win9X/NT/2000 version • QuickLoader with Full-screen editor included • Batchable loader and utilities included • Accepts Intel HEX, Tektronix HEX, Motorolla 'S' records and binary files • Free software updates via WEB downloads

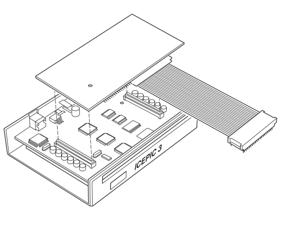
ICEPIC, ICEPIC2 and ICEPIC3 PIC Emulators



ICEPIC, ICEPIC2, and the ICEPIC3 emulators are fully modular, full speed, real time, in-circuit emulator systems, for use with Microchip PIC processors, using interchangeable "personality daughterboards" which connect directly to the users target board and are sold separately.

The ICEPIC3 Emulator is compact, portable, lightweight and offers exceptional performance and value. It uses a quick "hot" connection to the host computer via USB Port, with the system firmware being upgraded at any time from the internet giving total upgrade ability. The ICEPIC3 has additional real-time analysis when using the plug-in trace board which is sold separately.

All ICEPIC emulators operate within Microchip's MPLAB 32bit IDE giving the user easy control to perform efficient fast emulation. ICEPIC emulators are supplied as complete systems with power supply, cables, manual and a copy of Microchip's MPASM assembler.

zilog ZNEO™ Z16F Series

The ZNEO Z16F Series of Flash microcontrollers represents Zilog's evolution into 16-bit processing. The ZNEO Z16F CPU instruction set has been optimized for near single-cycle instructions yielding up to 20 MIPS at 20MHz. Combined with 128KB of zero wait state internal Flash, powerful math functions, 32-bit ALU supporting 8, 16 and 32-bit operations, embedded 32 x 32 multiply/ 64 x 32 divide operations, 16-bit bus widths (and external 16-bit bus for the Z16F2811's), the ZNEO Z16F delivers a powerful, yet cost effective micro-controller solution. A rich array of peripherals and analog features make this microcontroller suitable for a large number of applications from security panels to motor control.

Features: • WDT • POR • VBO • 12-Channel, 10-bit ADC • Analog Comparator • Operational Amplifier

Z8® Series Microcontrollers

Z8 MCU Family

OVERVIEW: Zilog MCU products are targeted for cost-sensitive, high-volume applications including consumer, automotive, security, and HVAC. One-time programmable (OTPs) for prototyping as well as volume production where time to market or code flexibility is critical. A variety of packaging options are available. The same on-chip peripherals are used across the MCU product line with the primary differences being the amount of ROM/RAM, number of I/O lines present, and packaging/temperature ranges available. This allows code written for one MCU device to be easily ported to another family member.

FEATURES: • **General-Purpose Register (GPR) File Architecture:** Every RAM register acts like an accumulator, speeding instruction execution and maximizing coding efficiency. Working register groups allow fast context switching. • **Flexible I/O:** I/O byte, nibble, and/or bit programmable as inputs or outputs. Outputs are software programmable as open-drain or push-pull on a port basis. Inputs are Schmitt-triggered with auto latches to hold unused inputs at a known voltage state. • **Analog Inputs:** Three input pins are software programmable as digital or analog inputs. When in the analog mode, two comparator inputs are provided with a common reference input. • **Timer/Counter (T/C):** The T/C consists of a programmable 6-bit prescaler and 8-bit downcounter, with maskable interrupt upon end-of-count. • **Interrupts:** There are six vectored interrupt sources with software-programmable enable and priority for each of the six sources. • **Watch-Dog Timer (WDT):** An internal WDT circuit is included as a fail-safe mechanism so that if software strays outside the bounds of normal operation, the WDT will timeout and reset the MCU. • **Auto Reset:** All family devices have internal Power-On Reset. • **Low-EMI Operation:** Mode is programmable via software or as a mask option. This new option provides for reduced radiated emission via clock and output drive circuit changes. • **Low-Power:** CMOS with two standby modes; STOP and HALT. • **Full Z8 Instruction Set:** Forty-eight basic instructions, supported by six addressing modes with the ability to operate on bits, nibbles, bytes, and words.

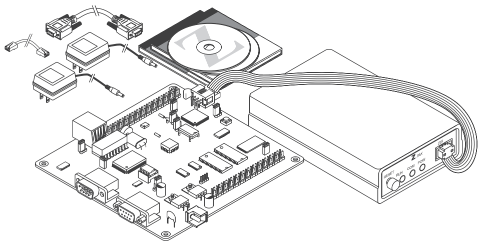
eZ80 - The Next Generation

EZ80190AZ050EC AND EZ80190AZ050SC



Just as the Z80 revolutionized the semiconductor industry, the next generation eZ80 is revolutionizing the way that communications are happening today. This elegant system-on-a-chip can serve web pages over a TCP/IP network, allowing easy system monitoring and control, effortless processor code updates, and system compatibility. This solution enables any browser with access to your network the ability to control and monitor a network application. The eZ80 executes Z80 code four times faster than traditional Z80s at the same clock speed, and can operate at speeds up to 50MHz. Unlike most 8-bit microprocessors, which can only address 64KB, the eZ80 can address 16MB without a Memory Management unit. The eZ80 Webserver also features an Embedded Internet Software Suite that enables the transmission and reception of HTML form data and the dynamic generation of web pages.

FEATURES: • 50MHz Processor • Multiply and Accumulate Engine • 16MB Linear Addressing • 3.3V Operation • 2 DMA Channels • Universal Zilog Interface (selectable UART, IIC, SPI) • 6 PRTs with Prescalers • 8KB SRAM • 32-Bit GPIO with Interrupt Support • On-Chip Oscillator • Optimized Pipeline Architecture • Zilog Debug Interface

Z8Plus™ Microcontrollers

Employing the experience gained from the industry-standard Z80 and Z8 cores, the Z8Plus offers increased functionality, significantly higher performance, lower power requirements, and greater cost savings over other 8-bit microcontrollers. The Z8Plus is designed to be easy to use, even for designers who have never used a microcontroller before.

With single-cycle execution, powerful I/O capabilities and register-to-register architecture, the Z8Plus offers state-of-the-art flexibility and freedom for any designer in search of a low-cost solution for a variety of microcontroller applications.

The Z8Plus core offers several significant advantages compared to the current Z8 core. Foremost is performance improvement due to a reduced system clock division and a fixed instruction cycle time. The improvement is nearly 50%, depending upon instruction mix. For example, a Z8Plus-based part at 10MHz has performance comparable to a 16MHz part in production today. This, along with significant design improvements, leads to lower power and lower noise operation.

The Z8PE002 and Z8PE003 microcontrollers are the newest members of the popular Z8E001 Z8 Plus 8-bit microcontroller family. New features include voltage brown-out protection and power-on reset. Additionally, the “RESET” pin has been replaced with a general purpose I/O pin and oscillator circuitry to support RC configurations. These new parts are targeted at customers who require a powerful, yet small OTP microcontroller for use in general purpose applications.

PSoC® (Programmable System on Chip) Microcontrollers

The Programmable System-on-Chip (PSoC) microcontrollers integrate a microcontroller and the analog and digital components that typically surround it in an embedded system. Easy-to-use development tools enable designers to select the precise peripheral functionality they desire, including analog functions such as amplifiers, ADCs, DACs, filters and comparators and digital functions such as timers, counters, PWMs, SPI and UARTs. The PSoC family's analog features include rail-to-rail inputs, programmable gain amplifiers and up to 14-bit ADCs with exceptionally low noise, input leakage and voltage offset. PSoC devices include up to 32KB of flash memory, 2KB of SRAM, an 8x8 multiplier with 32-bit accumulator, power and sleep monitoring circuits, and hardware I^{2}C USB and CapSense Technology communications.

Specifications: • Operating Voltage Range: 2.4V ~ 5.25V • Temperature Range: -40°C ~ 85°C

USB Controllers

Universal Serial Bus (USB) is the most common connectivity solution for PCs and consumer devices today. Plug and play, easy to use and simple to implement, USB continues to gain traction in new applications and market segments.

USB Low-Speed Peripherals

The low-speed USB peripheral family offers a broad range of devices that support applications requiring a signaling rate of 1.5Mbps. As an industry leader, Cypress offers powerful, flexible and integrated solutions for a wide range of USB applications. No other USB supplier makes it so easy and inexpensive to design and build USB applications. The low-speed USB controllers feature the industry's smallest 8-bit RISC core that contains RAM, EPROM/Flash, USB Logic and USB transceiver.

This family has three generations of products:

M8™ Series: The world's first integrated low-speed USB microcontroller.

enCoRe™: Enhanced Component Reduction technology reduces system cost through external component integration.

enCoRe™II: The second generation of Enhanced Component Reduction technology, adding flash memory and more integration.

enCoRe™III: Allows for customized peripheral configurations specific to your application, such as upgrading legacy serial interfaces to full-feature USB bridges.

Cypress offers a wide range of Programmable Logic Devices From PALs with 10 macrocells and 200 gates up to CPLDs with 3072 macrocells and 200,000 gates. Cypress also provides voltages ranging from 2.5V up to the typical 5.0V.

The Ultra37000™ family of CMOS CPLDs provides a range of high-density programmable logic solutions with unparalleled system performance. The Ultra37000 family is designed to bring the flexibility, ease of use, and performance of the 22V10 to high-density CPLDs. The architecture is based on a number of logic blocks that are connected by a Programmable Inter-connect Matrix (PIM). Each logic block features its own product term array, product term allocator, and 16 macrocells. The PIM distributes signals from the logic block outputs and all input pins to the logic block inputs. All of the Ultra37000 devices are electrically erasable and In-System Reprogrammable (ISR).

The Delta39K™ ISR™ CPLD Family based on a 0.18μm, six-layer metal CMOS logic process, offers a wide range of high-density solutions at unparalleled system performance. The Delta39K family is designed to combine the high speed, predictable timing, and ease of use of CPLDs with the high densities and low power of FPGAs. With devices ranging from 15,000 to 200,000 usable gates, the family features devices ten times the size of previously available CPLDs. Even at these large densities, the Delta39K family is fast enough to implement a fully synthesizable 64-bit, 66-MHz PCI core.

Microcontrollers 8-Bit 8051 Compatible

The 8051 microcontroller family remain one of the most popular processors in the world. Its ease of use and relatively high performance make it ideal for many applications, including portable and handheld products. The introduction of a line of high-performance derivatives has many positive implications for improving the power efficiency of 8051-based designs.
First, the use of a high-speed 8051 microcontroller can significantly improve power efficiency. A high performance CPU allows the processor clock to be slowed, resulting in the same level of performance at less power. Alternatively, the performance of an existing system can be increased without increasing power consumption. Second, a device which incorporates all needed peripherals should be selected if possible. If extra data memory is required, a device such as the DS87C520 should be used, which incorporates 1 kilobyte of internal MOVX SRAM. One of the strengths of the 8051 product family is the wide variety of on-chip peripherals. Features such as watchdog timers, additional UARTs, and precision reset circuits are available on high-speed microcontrollers.

Soft Microcontroller Modules

DS5000(T) Soft Microcontroller Module is a fully 8051-compatible 8-bit CMOS microcontroller that offers "softness" in all aspects of its application. This is accomplished through the comprehensive use of nonvolatile technology to preserve all information in the absence of system Vcc. The internal program/data memory space is implemented using either 8 or 32 kilobytes of nonvolatile CMOS SRAM. **DS2250(T) and DS2252(T)** have the same features as the DS5000 but with an added feature. The program/data memory space is implemented using 8, 32, or 64 kilobytes of nonvolatile CMOS SRAM. **DS2251(T)** has the same features as the DS5000 but with an added feature. The program/data memory space is implemented using 32, 64 or 128 kilobytes of nonvolatile CMOS SRAM.

ARM7 Microcontrollers

The LPC2000 architecture is based on a 16/32-bit ARM7TDMI-S™ CPU with real-time emulation and embedded trace support. A 128-bit wide memory interface and a unique accelerator architecture enable 32-bit code execution at maximum clock rate. For critical code size applications, the alternative 16-bit Thumb™ mode reduces code by more than 30% with minimal performance penalty. Due to their tiny size and low power consumption, these microcontrollers are ideal for applications where miniaturization is a key requirement. **Features:** • 16/32-bit ARM7TDMI-S processor • Up to 512kB on-chip Static RAM • In-System Programming (ISP) and In-Application Programming (IAP) via on-chip boot loader software • Vectored Interrupt Controller with configurable priorities and vector addresses • Embedded ICE-RT interface enables breakpoints and watch points. Interrupt service routines can continue to execute whilst the foreground task is debugged with the on-chip RealMonitor™ software • Embedded Trace Macrocell enables non-intrusive high speed real-time tracing of instruction execution • Multiple serial interfaces

ARM9 Microcontrollers

The LPC3180 is based on the ARM926EJ-S core and offers a hardware vector fl0oating-point unit for speed and efficiency. An integrated USB OTG interface with full host capability lets this high performance microcontroller connect directly to PDAs, smart-card readers and printers. The large array of peripherals available on chip also include UARTs, SPI, I^2C, a real-time clock with a separated power domain and NAND Flash and DDR memory controllers.

OMAP — ARM9 + C55x

OMAP Processors integrating the command and control functionality of ARM, coupled with low-power, real-time signal processing capabilities of a DSP.
The OMAP59xx platform is ideal for portable data terminal applications such as portable medical devices (portable defibrillation, home medical test and analysis) asset and inventory management, (parcel tracking and location, stock inventory and replenishment, real-time data capture with analysis and interpretation) and point of sale (sales and membership processing, merchandising and pricing management verification and authentication) It enables embedded developers to program using familiar development environments by supporting leading operating systems such as Microsoft® Windows® CE.NET, Linux®, and TI's DSP/BIOS real-time scalable kernel. This open development environment makes it possible for designers to deliver innovative products to the market faster, utilizing familiar tools, a standard application programming interface (API) and a seamless interface to the DSP through an optimized interprocessor communication mechanism. The built-in interprocessor communication mechanism eliminates the need for developers to program the RISC and DSP independently resulting in reduced programming efforts.

TMS470 Family

The TMS470 is derived from the 32-bit ARM7TDMI® core. This industry standard architecture includes two instruction sets, a 32-bit instructions for fast execution and 16-bit instructions for high code density. It allows unlimited switching between instruction sets and also provides run time decompression. Typical applications include industrial systems, medical instrumentation, consumer electronics, data processing and many other general purpose embedded applications.

Microcontrollers

For the mass market ST offers several families of microcontrollers, e.g. the ST6, ST7, STM8S20, ST9 and the ST10 ranges, with the result that there is a ST microcontroller to suit every kind of application, from those where minimum cost is the primary requirement to those that need powerful real-time performance and high-level language support. ST also offers the innovative Programmable System Memory (FlashPSD, DSM) products, which combine memory functions such as Flash, EEPROM and SRAM with programmable logic on a single chip. Designed to interface with all standard microcontrollers to provide a complete system implementation, Programmable System Memories can be quickly and easily programmed without special manufacturing equipment, even in the field.

STM32 Cortex™ Microcontrollers

The STM32 family of 32-bit Flash microcontrollers is based on the breakthrough ARM®Cortex™-M3 core, which is specifically developed for embedded applications requiring a combination of high performance, low power and low cost. The STM32 family benefits from the Cortex™-M3 architectural enhancements (including the Thumb-2® instruction set) that deliver improved performance combined with better code density, and a tightly coupled nested vectored interrupt controller that significantly speeds response to interrupts, all combined with industry-leading power consumption.

FlashLINK JTAG Programming Cable for PSD and uPSD

The family of Flash PSD and uPSD devices offer In-System Programming (ISP) allowing a completely blank device to be programmed while soldered to a circuit board. This simplifies manufacturing and provides an effective way to update products after they are in use. Flash PSD and uPSD devices comply to the core requirements of the IEEE 1149.1 JTAG specification. However, these devices do not support boundary scan functions. Instead, they support ISP, and some uPSD devices support emulation through JTAG.
